```

Figure 2 Apache and MySQL running

XAMPP Apache + MariaDB + PHP + Perl

Welcome to XAMPP for Windows 8.2.12

You have successfully installed XAMPP on this system! Now you can start using Apache, MariaDB, PHP and other components. You can find more info in the [FAQs](#) section or check the [HOW-TO Guides](#) for getting started with PHP applications.

XAMPP is meant only for development purposes. It has certain configuration settings that make it easy to develop locally but insecure if you want to have your installation accessible to others.

Start the XAMPP Control Panel to check the server status.

Figure 3 Localhost Test Page

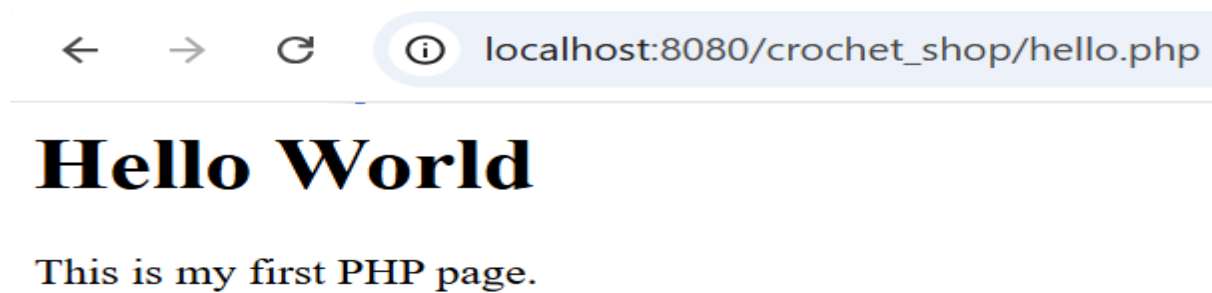

Figure 4 Hello World Test

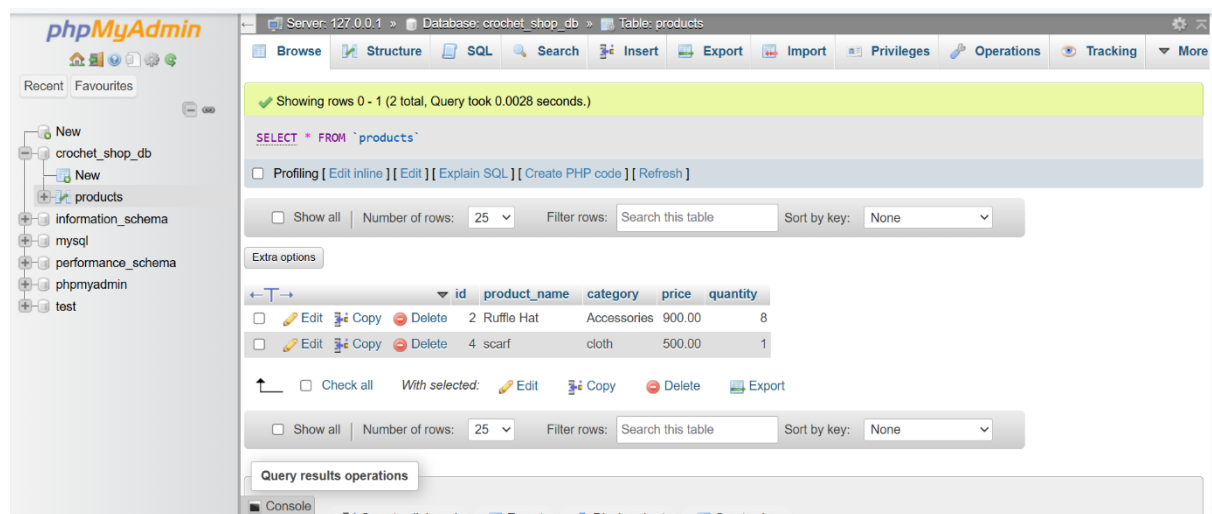

Figure 5 Database Connection Test

Week 1 Reflection

This practical involved setting up a local web development environment using XAMPP, which includes Apache, MySQL, and PHP.

FIG 1 shows the installation of XAMPP on the system.

FIG 2 shows Apache and MySQL services running successfully in the XAMPP control panel.

FIG 3 shows the localhost test page confirming the server was working.

FIG 4 shows the Hello World test page created using PHP.

FIG 5 shows a successful connection between PHP and MySQL using db_connect.php, confirming that Apache and MySQL services were properly configured in XAMPP.

The main challenges faced included server startup errors and configuration issues.

Week 2

User Interface Planning and System Design

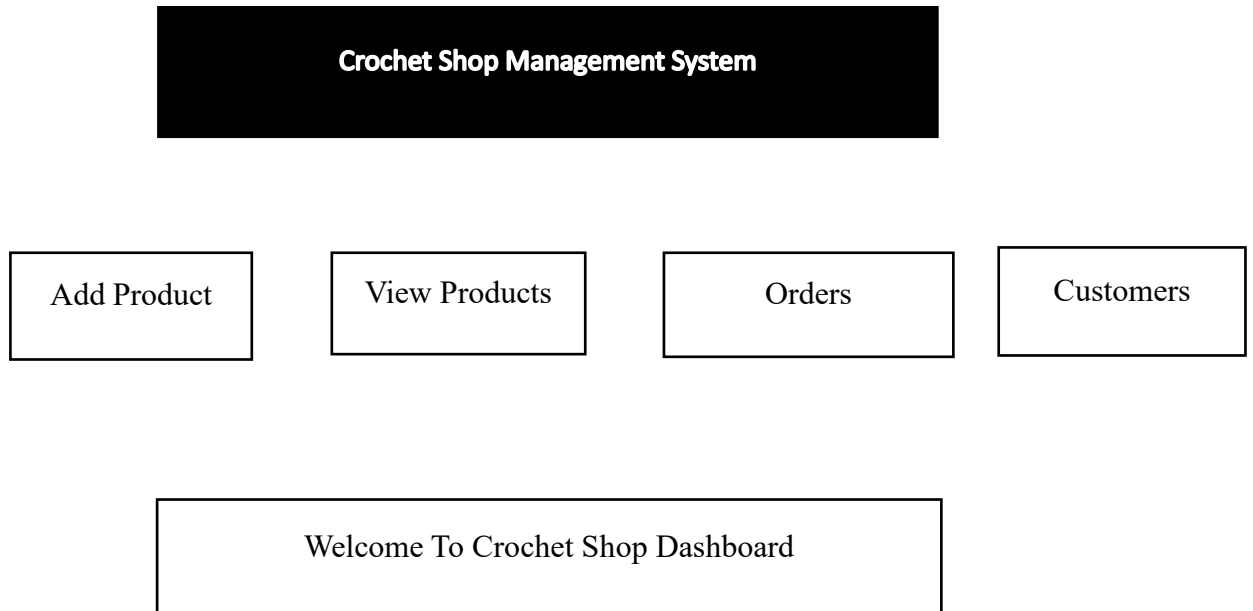

Figure 6 Hand drawn wireframe

Figure 7 Dashboard layout design

Figure 8 mobile view mockup

System Component	Selected Color	Purpose
Navigation Bar	Blue	Main navigation
Hero Section	Dark Overlay + Background Image	Visual appeal
Add Product Button	Blue	Product management
View Products Button	Green	View inventory
Orders Button	Yellow	Order management
Customers Button	Red	Customer management
Background	White	Clean interface

Figure 9 Color Theme and Navigation Structure

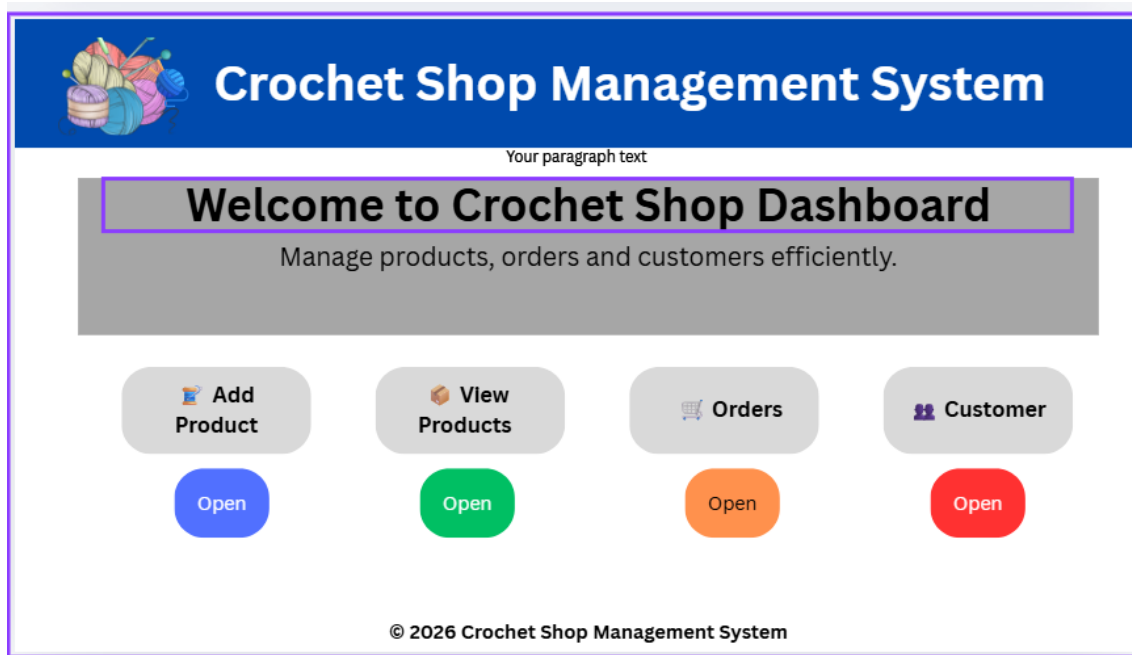

Figure 10 GUI Prototype in Canva

Week 2 Reflection

The user interface was designed to be simple, attractive, and easy to use for crochet shop owners and staff.

A dashboard layout was selected to provide quick access to the main system modules, including Add Product, View Products, Orders, and Customers.

The chosen color theme improves visual appeal while maintaining readability.

The navigation structure was planned to reduce the number of clicks required to access important functions.

Mobile view mockups were also considered to ensure responsiveness and accessibility across different devices.

The design aims to improve efficiency in managing crochet shop operations.

Week 3

Frontend interaction and Backend foundations

Product Validation Form

Product Name:

Submit

scrunchie

Category

hair accessory

Price

500

Quantity

4

Add Product Back Home

Figure 15 Dynamic User Input Handling

Week 3 Reflection

Week 3 focused on frontend interaction and backend development using JavaScript, PHP, and MySQL.

JavaScript was used to validate user input and provide instant feedback through form validation and password strength checking.

PHP was used to process user input and perform server-side operations.

The database connection script established communication between PHP and MySQL, enabling data storage and retrieval.

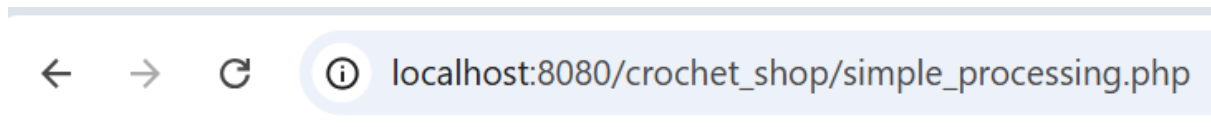

Dynamic user input handling was demonstrated through the product management form, where submitted data was processed and stored in the database.

These activities improved my understanding of how frontend and backend technologies work together.

Week 4

Introduction To Dynamic Backend Processing and Real User Interaction Systems

1. Understanding Server-side programming

Simple PHP Processing Page

Welcome Debbie

Session Example

Welcome Debbie

Figure 20 Session basics

```
db_connect.php
1  <?php
2
3  $servername = "localhost";
4  $username = "root";
5  $password = "";
6  $database = "crochet_shop_db";
7
8  $conn = mysqli_connect($servername, $username, $password,
9
10 if (!$conn) {
11     die("Connection failed: " . mysqli_connect_error());
12 }
13
14 ?>
```

Figure 21 Code snippets

Week 4 reflection

Week 4 introduced server-side programming concepts using PHP.

I learned how forms send data from the browser to the server using the POST method and how PHP processes user input to generate dynamic content.

A basic login system was developed to demonstrate authentication concepts, while sessions were used to maintain user information across pages.

Folder organization practices were also introduced to improve project structure and maintainability.

These activities helped me understand the interaction between frontend interfaces and backend processing in web applications.

Week 5

Database Components and CRUD Operations

Figure 22 Database Creation

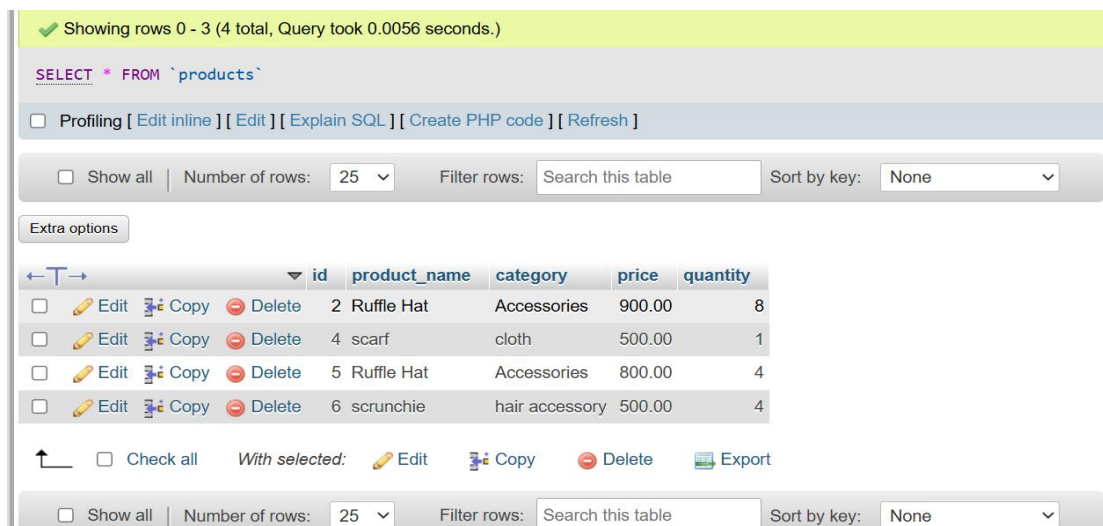

Figure 23 Table Creation

Add New Crochet Product

Product Name
sweater

Category
clothing

Price
2500

Quantity

SQL Query:

Login Successful

Figure 27 Database-integrated login system

Week 5 reflection

Week 5 focused on database-driven web development using MySQL and PHP.

A database and products table were created to store application data. CRUD operations were implemented to allow users to create, view, update, and delete product records.

PHP was used to connect the application to the database and retrieve dynamic information.

These activities demonstrated how databases support real-world applications by enabling efficient storage, management, and retrieval of data.

The practical exercises improved my understanding of backend integration and database Management in web development.

APPENDIX 1: Github Repository Screenshot

The screenshot shows a GitHub repository page for 'crochet-shop-management-system' by user 'Akiana-hub'. The repository is public and has 2 commits. The file list includes README.md, add_product.php, customers.php, db_connect.php, delete_product.php, dynamic_welcome.php, edit_product.php, form_submission.php, hello.php, index.php, login.php, orders.php, password_checker.html, php_practice.php, and session_welcome.php. The right sidebar shows the repository's description, activity, and contributors.

Repository Details:

- Repository: `crochet-shop-management-system` (Public)
- Branch: `main` (1 Branch, 0 Tags)
- Commits: 2
- Stars: 0
- Forks: 0

File List:

File Name	Commit Message	Time
README.md	Initial commit	6 minutes ago
add_product.php	Add files via upload	now
customers.php	Add files via upload	now
db_connect.php	Add files via upload	now
delete_product.php	Add files via upload	now
dynamic_welcome.php	Add files via upload	now
edit_product.php	Add files via upload	now
form_submission.php	Add files via upload	now
